maksim-miliutin.com · bronykashop.com
Russia, open to relocation and visa sponsorship · English at working level, no French yet

I build products end to end and keep them running. Bronyka Shop is a marketplace I designed, wrote and deployed alone: it serves real customers, and every incident on it is mine to fix. Beside it sit eight more products: 173,099 lines of TypeScript, and two tools in Go with nothing in their go.mod. I write tests for anything that touches someone's money or their progress, and I would rather show "cannot compute" than a confident wrong number.

SELECTED WORK

Bronyka Shop, production e-commerce marketplace · 2026 to present

NestJS · Prisma · PostgreSQL · Redis · React · Docker · nginx · Cloudflare R2
250+ registered users · 252 products listed · 70+ orders processed

· Sole engineer across the whole stack: schema, REST API, storefront, deployment and production upkeep.

· JWT authentication with refresh rotation: the old session is deleted on exchange, the token is stored as a bcrypt hash, and a token that fails the check revokes every session for that user.

· Real-time buyer and seller messaging over WebSockets, with an admin panel for live message routing.

· Mobile-first PWA with offline support, RU and EN internationalisation, SEO (sitemap, Open Graph).

Netwatch, published desktop tool and browser extension · 2026

Go, standard library only · TypeScript · Chrome and Firefox extension (MV3)
Released on GitHub · published on addons.mozilla.org · 11 tested packages

· One Go binary with an empty go.mod: the Discord client is reached over its own socket rather than through a library, and the tray icon is drawn through syscall by hand.

· Recognises 37 streaming services. A player that keeps the track out of the address is asked through the page instead, which is how Yandex Music is read at all.

· Listens on loopback only and refuses any request that did not come from its own page. Nothing leaves the machine except the Discord card.

· Four services were silently not being recorded for weeks. Each was found by probing a running build rather than by reading the code, which is why the packages are under test and the extension is not.

Trellis, language-learning platform, in progress · 2026

TypeScript · gRPC · Prisma · Expo · React Native · monorepo
97,494 lines · 358 files · 598 tests · six languages

· Grammar modelled as a dependency graph: a topic unlocks once its prerequisites are consolidated, and a mistake in an essay drops that topic back into review.

· Exercises expanded from templates ahead of time and filled only with words the learner already knows, because an unfamiliar word turns a grammar check into a vocabulary check.

· Learning logic imports no framework: server, app and tests execute the same code, so no rule exists in three drifting copies.

· Not shipped yet. Logic and the seams between layers are covered by tests; the app has not been run end to end.

Reste, French medical quote calculator · github.com/maksim-miliutin/Reste

React Native · TypeScript strict · GitHub Actions
67 tests · every rate dated and sourced

· Computes what a patient actually pays: an 800 euro crown returns 84, because cover is a share of a reimbursement base that can be a fifth of the price.

· Every rate carries the dates it was in force and a link to its source, so a figure that goes stale stops answering instead of answering wrongly.

· CI runs typecheck, lint and tests plus two custom checks: logic unreachable from the UI, and translation keys the screens ask for but no dictionary provides.

ALSO BUILT

· **Obxod**, DPI bypass for Windows in Go. Cuts a TLS hello at the name boundary into four and writes the real name over the forged one, so the inspector reads in order of arrival while the server reassembles by number. Packet arithmetic against a signed kernel driver.

· **NetCheck**, network diagnosis in TypeScript, a thousand odd tests, now closed. It named the layer where a connection stops working: the router, the provider, the names, the handshake. The measuring half of it went on into Obxod.

· **Veilla**, daily check-in calls for an elderly parent living alone. Monorepo of 7 packages, 157 checks. Transcript and audio are never stored, and suppressed alarms are a measured number.

· **Pasmurno**, mood journal for a circle of five close people. NestJS, Prisma and Expo, 8 languages, chat encrypted on device and never stored on the server.

· **Vydokh**, quitting vape without shame. A slip resets the current streak and leaves best streak and total clean days alone. Expo and Supabase, 7 languages, 262 core tests.

· **Mira**, camera on a plate for calories and macros, camera on yourself for a face and skin read, correlated on device. Expo SDK 57, React 19, 8 languages.

TECHNICAL SKILLS

Languages TypeScript, JavaScript, Go, Python, SQL, C#, C++
Backend NestJS, Node.js, Prisma, PostgreSQL, Redis, gRPC, REST, WebSockets (Socket.IO), JWT
Frontend React, React Native, Expo, Vite, TanStack Query, Zustand, i18next, PWA
Infra Docker, Docker Compose, nginx, Cloudflare and R2, Supabase, Sentry, GitHub Actions, Ubuntu
Also .NET (EF Core), Qt, libpqxx, WinDivert, browser extensions (MV3)

EDUCATION

RTU MIREA, Russian Technological University Computer Science, two years completed
